

# PARR reporting: End to end process

---

11<sup>th</sup> February 2020

# Receiving raw reports

CDSP upload reports to the FTP server around the 15<sup>th</sup> of each month (seven files provided)

PAFA retrieve data from the FTP once notified of upload and is saved locally on the secure Gemserv network.

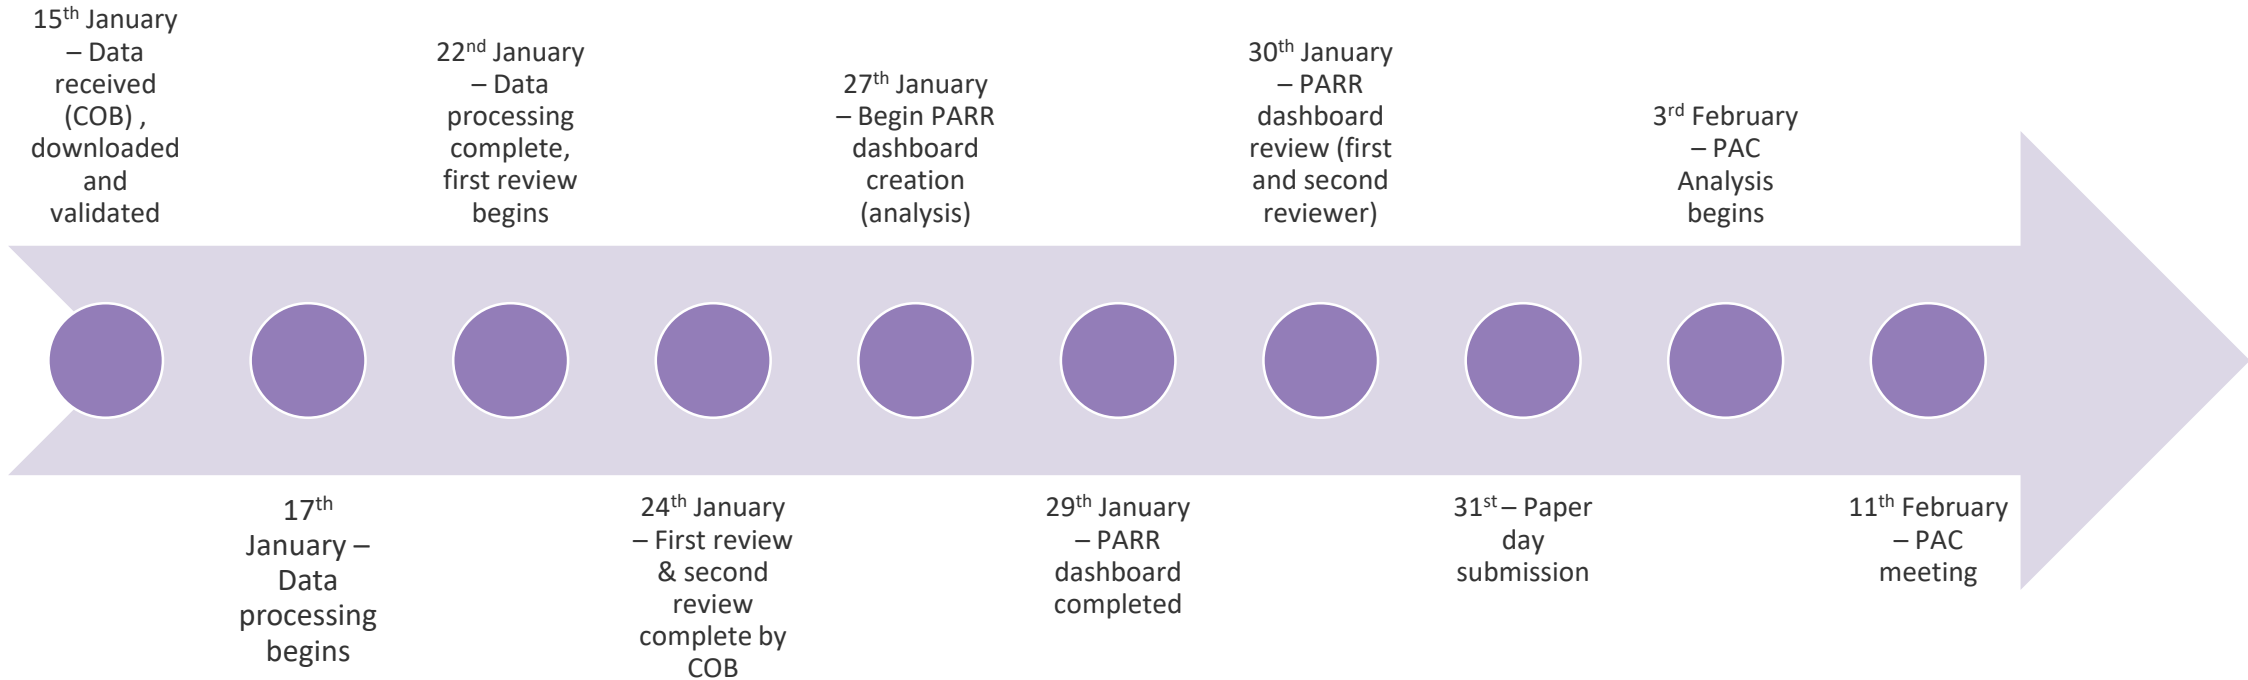

# Data outputs....

- **Data is stored locally with only the PAFA team having access to the reports.**
- **Data needs to be validated, processed and published by PAC paper day. Prior to publishing, it needs to be reviewed by various personnel to ensure accuracy of data as well as maintaining data confidentiality.**
- **The files to be produced:**
  - **Anonymised report**
  - **Non-anonymised report**
  - **PARR dashboard**
  - **Shipper performance analysis (PAC view only).**

# Data processing timeline (January)

# Data Discovery Platform (DDP)

---

- DDP offers the opportunity to revise the timeline but does not change dates when current industry processes run
- For example, currently 'legacy' PARR reports are run on 12<sup>th</sup> to maximise the number of meter reads coming into settlement after a reporting month closes-out
