

Please find comments for the work group report.

Regards

Richard Fairholme, Uniper.

Under Gas Storage it says:

“The Holford Storage site in Cheshire was identified through the course of the Modification process as the only gas storage facility likely to receive gas with a higher level of CO₂ than at present”

There is more than just Holford’s gas storage site in the North-West – notably Storengy’s Stublich gas storage facility, which is adjacent to Holford. As a result, I’d suggest a change along the lines of:

“The Holford Storage site in Cheshire was identified through the course of the Modification process as one gas storage facility likely to receive gas with a higher level of CO₂ than at present”

Or

“Gas storage in the North-West of England was identified through the course of the Modification process as likely to receive gas with a higher level of CO₂ than at present”

We can discuss in the workgroup meeting.
