1 Request

Why is the Request being made?

The current entry and exit capacity arrangements for Users to access the NTS were built on the foundations of an expanding gas transmission network. Historically, incremental capacity signals from long-term auctions would trigger investment on the NTS. Today, this environment has changed and we are not experiencing the capacity signals requiring expansion of the network we were 10 years ago¹. Therefore, this Request is being raised to review the principles of the capacity access arrangements to ensure they are aligned to future needs of our customers and allow optimal development of the NTS.

This review will commence at a strategic level, looking at the long-term ambition for the NTS capacity access regime, including ensuring the regime is appropriate for commercial behaviours being experienced today, simplified and adaptable whilst being consistent with European obligations. Specific short-term problems identified by customers will be addressed consistently with the long-term ambition.

Scope

To review the principles of the NTS capacity access regime, understanding issues and developing a long-term strategy. Making recommendations for change and addressing short-term problems in accordance with the long-term ambition.

1. Long-term Ambition			
<ul style="list-style-type: none"> A capacity regime which is; <ul style="list-style-type: none"> appropriate for commercial behaviours being experienced today simplified adaptable for the impact of ongoing industry change (e.g. Charging Review, Energy Codes Review, Baselines Review) and future developments of the gas network (e.g. hydrogen future) consistent with obligations at an European level (e.g. European Codes) 			
2. Short-term Problems			
A	Substitution	Is the process and the associated timescales appropriate? (Lead times, Ofgem approval, treatment of decommissioned sites)	Governance
	Retainers	Are retainers still required with the introduction of PARCA?	
	Trade and Transfer	Any issues?	
	Zonal	Possible alternative solution to substitution and transfer	
B	Over-run charges	Are Over-run charges appropriate and incentivising "right" behaviour?	UNC / Methodology
C	PARCA	Appropriateness of fees Embedding and extending the "PARCA light process" embedded with CLoCC.	
D	User Commitment	Are the levels of User Commitment appropriate? <i>Potential links with PARCA and substitution</i>	
E	Capacity Products	Any new products required or redundant products? <i>Including additional auctions (e.g. duration); conditional products (e.g. temperature)</i>	
	Auctions / Applications	Any new processes, redundant processes or refined processes?	Are the rules contained in the right place?
F	Flex	Dependent on outcome of network capability work	
		Is the existing flex product appropriate for Tx?

Impacts & Costs

The key impacts of this Request are currently considered to be:

- Possible changes to systems and business processes required to implement new capacity access arrangements
- Potential changes to governance documents (UNC and Gas Transporter Licence) to reflect amended capacity access arrangements
- Possible increase in Competition, Security of Supply and the efficient use of the total system due to improved arrangements for accessing NTS capacity.
- Any improvements to transportation arrangements should result in net benefit to consumers.

Recommendations

The objective of this Request is to explore the long-term needs of the capacity access regime and how short-term problems can be resolved in accordance with the future ambition. This Request should be issued to Workgroup for consideration.

2 Impacts and Costs

Consideration of Wider Industry Impacts

Possible wider industry impacts and costs of the output of the Request are highlights below. However, until more detail is worked through, specific impacts cannot be identified.

Impacts

Impact on Central Systems and Process	
Central System/Process	
UK Link	<ul style="list-style-type: none"> • None identified
Operational Processes	<ul style="list-style-type: none"> • Work streams identified are likely to have an impact on Transporter Operational Processes (e.g. potential amendments to the Substitution and PARCA processes)

Impact on Users	
Area of Users' business	
Administrative and operational	<ul style="list-style-type: none"> • Changes may be implemented which impact Users operational process, for example the introduction of a within day off-peak / interruptible capacity product would provide Users with more product diversity which they may want to adapt operational processes to utilise
Development, capital and operating costs	<ul style="list-style-type: none"> • Work streams included in this Request could result in lower costs for Users (e.g. optimising their capacity bookings through the availability of additional products, or changes to User Commitment requirements)
Contractual risks	<ul style="list-style-type: none"> • None identified

Impact on Users	
Legislative, regulatory and contractual obligations and relationships	<ul style="list-style-type: none"> Review of the substitution methodology may introduce contractual changes (for example, removal of applicant confidentiality as part of PARCA)

Impact on Transporters	
Area of Transporters' business	
System operation	<ul style="list-style-type: none"> Various changes being considered as part of this Request may have an impact on Transporters' system operation (for example, the development of new capacity products)
Development, capital and operating costs	<ul style="list-style-type: none"> None identified
Recovery of costs	<ul style="list-style-type: none"> There are areas being considered in this Request which may impact the recovery of Transporter costs (e.g. a discounted within day product could impact the method by which the Transporter collects its allowed Revenue).
Price regulation	<ul style="list-style-type: none"> None identified
Contractual risks	<ul style="list-style-type: none"> None identified
Legislative, regulatory and contractual obligations and relationships	<ul style="list-style-type: none"> There may be changes to the PARCA process impacting contractual obligations
Standards of service	<ul style="list-style-type: none"> None identified

Impact on Code Administration	
Area of Code Administration	None identified.
Modification Rules	<ul style="list-style-type: none">
UNC Committees	<ul style="list-style-type: none">
General administration	<ul style="list-style-type: none">
DSC Committees	<ul style="list-style-type: none">

Impact on Code	
Code section	Potential impact
TPD Section B	<ul style="list-style-type: none"> The focus of the review is on capacity processes and therefore likely to have future impacts either directly through this Request or through "spin-off" modifications to implement specific changes (i.e. UNC Modification 0716 "Revision of the Overrun Multiplier").

Impact on UNC Related Documents and Other Referenced Documents	
Related Document	None identified
Network Entry Agreement (TPD I1.3)	•
General	None identified.
Legal Text Guidance Document	•
UNC Modification Proposals – Guidance for Proposers	•
Self Governance Guidance	•

Impact on UNC Related Documents and Other Referenced Documents	
Measurement Error Notification Guidelines (TPD V12)	•
EID	None identified
Moffat Designated Arrangements	•
IGTAD	None identified.
DSC / CDSP	None identified
Change Management Procedures	•
Contract Management Procedures	•
Credit Policy	•
Credit Rules	• None identified
UK Link Manual	• None identified

Impact on Core Industry Documents and other documents	
Document	Potential impact
Safety Case or other document under Gas Safety (Management) Regulations	• None identified
Gas Transporter Licence	• Changes to areas such as substitution governance would require a Licence change. There may also be the requirement for methodology changes (ECR and ExCR for User Commitment changes)

Other Impacts	
Item impacted	Potential impact
Security of Supply	• Changes to processes could affect security of supply by affecting the attractiveness of the GB market.
Operation of the Total System	• Changes on the exit side of the regime could result in impact on the operation of the Total Gas System (e.g. NTS and DN's)
Industry fragmentation	• None identified
Terminal operators, consumers, connected system operators, suppliers, producers and other non code parties	• Changes identified could reduce shipper's costs which may be passed onto end consumers
	•
	•

3 Terms of Reference

Topics for Discussion

- Agree “Scope” of Capacity Access Review
- Understand the future long-term ambition for a capacity regime
- “No regrets” solutions to meet short-term problems consistent with the long-term strategy
- Development of Solution (including business rules if appropriate)
- Assessment of potential impacts of the Request
- Assessment of implementation costs of any solution identified during the Request

Outputs

Produce a Workgroup Report for submission to the Modification Panel, containing the assessment and recommendations of the Workgroup including a draft modification(s) where appropriate.

Composition of Workgroup

The Workgroup is open to any party that wishes to attend or participate.

A Workgroup meeting will be quorate provided at least two Transporter and two User representatives are present.

Meeting Arrangements

Meetings will be administered by the Joint Office and conducted in accordance with the Code Administration Code of Practice.

4 Request Workgroup Assessment

Part One - Request Update October 2020

The following paragraph is designed to update the reader as to what has happened in the time that 0705R has been under consideration at Workgroup.

Request 0705R NTS Capacity Access Review was raised on 17 October 2019 and has been actively discussed at the Transmission Workgroup meetings and National Grid have conducted offline meetings with key stakeholders. An interim presentation was presented at the March 2020 UNC panel, providing an update. This update covered the following areas

- Scope of Review
- Long-Term Strategy including Consultation feedback
- Short-Term Issues (Grouped by Workstreams (detailed below)
The short-term issues, which formed the initial scope of the Request, have been refined following the conclusion of a consultation in January 2020. As a result, the following work streams are currently in flight under the umbrella of 0705R NTS Capacity Access Review, more detail is provided on each of these work-streams in this section.
- Overrun Charges
- Entry User Commitment

- Exit User Commitment
- Substitution
- Secondary Capacity Assignments
- Capacity product development

The approach for the first year of the Request has been to focus on immediate problems being faced by industry (including some capacity consequences of the soon to be implemented UNC Modification 0678A) in October 2020. This approach has inevitably meant making adjustments to the existing regimes. If sanctioned by Panel, the proposal would be in Year 2 of the Capacity Access Review to look at the reform required from a principles basis outlined in the 'Future Work and Timescales' section below.

Overrun Charges

Consequentially to the introduction of UNC Modification 0678A 'Amendments to Gas Transmission Charging Regime', a significant increase in the average Overrun Charge for both Entry and Exit was foreseen due to reserve prices increasing from 1st October 2020. A solution was put forward by National Grid (UNC Modification 0716 – 'Revision of Overrun Charge Multiplier') to lower the level of Overrun charges by reducing the Overrun multiplier from x8 to x3 for Entry and from x8 to x6 for Exit. It was developed on the principle that these multipliers would maintain the status quo in terms of revenue created by Overruns, therefore maintaining the same incentive on Users to book capacity according to their flows meaning there would be no worsening of capacity booking behavior could be assumed. An alternative Modification 0716A was developed which introduced the multiplier of 1.1 on both Entry and Exit points. Ofgem's UNC Notice of implementation on 18th September implemented Modification 0716 – Revision of Overrun Charge Multiplier with effect from 1st October 2020 and also issued a notice of non-implementation for Modification 0716A. Ofgem noted that Modification 0716 suggestion to review the overruns following the experience of how UNC 0678A impacts user behaviour was welcomed

Entry User Commitment

This work stream is about amending the current Entry User Commitment baseline capacity requirement to trigger Substitution and Obligated Funded Incremental capacity. Industry suggested that the baseline capacity requirements were too onerous, could prevent access to the market and could sterilise capacity which is not required. In response, National Grid have proposed an amendment to the baseline capacity commitment required to trigger substitution and obligated funded incremental to reduce this from 16 quarters to 4 quarters in a 32-quarter period. This change requires an amendment to the Entry Capacity Release methodology statement which National Grid are currently progressing.

Exit User Commitment

For Exit User Commitment, the Enduring Annual NTS Exit capacity product allows users to book capacity between 4 and 6 years ahead of the gas day. Users then remain the registered User in respect of any Enduring Annual NTS Exit Capacity for 4 years from the date the increased capacity allocation becomes effective (unless paid off early if indicative prices are different to reserve prices). Users have identified the difficulty faced in forecasting capacity requirements 4 years ahead and then not being able to release any capacity which is subsequently no longer required due to User Commitment requirements. This could lead to overbooking and sterilisation of that capacity. Conversely, Users can not increase their capacity bookings without resetting the User Commitment period. The alternative would be to buy capacity in the annual auction but this creates a risk of the

capacity at the exit point that the User is active at, being used to fulfil a substitution request. This is particularly pertinent for Distribution Networks who have 1 in 20 demand obligations to meet and are the predominant Users of Enduring capacity.

Users indicated that a “quick fix” would be desirable in this area to reduce the level of User Commitment prior to the next Enduring Annual Application window in July 2021. Therefore, this work-stream is looking at amending Exit User Commitment requirements for capacity within baseline purchased through the Enduring Annual NTS Exit application. However, National Grid are concerned that a reduction to User Commitment may lead to inefficient network planning, substitution and investment decisions being made and may adversely impact the operation of the network. National Grid and Distribution Networks (predominant advocate for the change) are working closely together to quantify benefits, assess related risks and analyse different options as potential solutions. After several discussions, National Grid is currently going through internal processes to make a decision on which option National Grid can support before communicating this to Transmission Workgroup.

NGN, SGN and WWU were strongly of the view that there should be no Exit User Commitment for Enduring Capacity bookings below baseline where no investment is required. Their view was that NG has an obligation to provide this capacity and if the baseline capacity is not available then this is due to a commercial decision by NG and that DNs should not have to pay NG’s decision not to meet their obligations.

NGN’s, SGN’s and WWU’s views were that when exit capacity charges reflected the marginal cost of providing capacity and demand was increasing, User Commitment may have, in the round, been a rough way for recovering costs of reinforcing the NTS even though a case-by-case assessment as used by DNs would have been more accurate. From 1st October 2020 NTS charges no longer try to reflect the cost of providing capacity and demand on the NTS is generally declining meaning that reinforcement is less likely to be required. The blanket application of a four-year User Commitment requirement cannot be defended in relation to providing Economical connections to the NTS in relation to NG’s obligations under section 9 of the Gas Act”

National Grid recognise that User Commitment is not solely required for investment purposes or to enable NG to fulfil our obligations to meet baseline capacity requirements. Moreover, User Commitment is required for Users to provide an ongoing level of commitment to that capacity, be that baseline or incremental. National Grid requires that commitment to baseline capacity as network management decisions are based on levels of capacity committed to which could be undermined if no commitment is provided.”

Substitution

Feedback relating to the substitution process was received as a part of the consultation in January 2020. It was highlighted that when substitution is triggered as part of the auctions (QSEC and EAFLEC), no notice is given to the industry to be able to respond; when substitution is triggered through the PARCA (Planning and Advanced Reservation of Capacity Agreement) process. Whilst a notice is provided, this notice is not specific enough in terms of geographical location which results in capacity being used to fulfil the substitution requirement when it may have still been required by the party active at the donor point, albeit not booked. This could result in Users not being able to access capacity in the shorter-term auctions that they require (for example, in the case of DN’s to book capacity according to their 1 in 20 obligations for security of supply purposes).

This work-stream has looked at whether a “quick fix” could be found. One option considered was to provide “first refusal” to a User active at the identified donor point. Although this option was supported by industry, National Grid could not support this due to the risk of a perpetual cycle of analysis which

this created. Furthermore, National Grid thought this could undermine the principle of capacity being a competitive product (a concept which warrants a review in its own right). Further options being assessed in this work-stream include channelling all Entry and Exit capacity signals to be met by substitution via the PARCA process as this would provide notice of the signal to industry and removing the confidentiality around the PARCA project location. Options are being considered by Transmission Workgroup. Next steps are to continue to investigate some further possible options (i.e. the removal of confidentiality of PARCA applications). Following this, workgroup will be asked to make a decision in November 2020 as to which, if any option(s) would be worthwhile pursuing in the immediate future or whether this is a topic which should be considered alongside the development of the principles of the exit regime.

Secondary Capacity Assignments

The secondary capacity work stream has only recently been incorporated into the Capacity Access Review and is still in its infancy. Born out of a discussion within the NTS Charging Methodology Forum, this topic has been explored in a number of informal workgroups, within which industry have established a set of requirements which have been drawn together in a scoping document.

National Grid are supportive of the general theme of the requirements, a desire to develop the existing Exit Assignments process and introduce the concept of Assignments to the Entry market. At this stage, there are no firm timelines and no decisions have been made on what, if anything, would be included in any potential modification. National Grid are in the process of internally considering each of the industry requirements established in the scoping document before making any further steps towards a modification and more formal workgroup development. National Grid will then return to Transmission Workgroup with a position on which industry requirements in this area, can be supported. Industries preferred implementation timescale of October 2021 is recognised by National Grid.

Capacity Product Development

In this work stream, the potential for two new capacity products is being developed. Firstly, development of a shorter-term exit product which enables Users greater flexibility to interact with the electricity market. Secondly a within day off-peak / interruptible product. The latter stems from changes being introduced as a result of UNC Modification 0678A where there is a discount of 10% from reserve prices for the current day ahead off-peak / interruptible product. Users would like to have the flexibility to book this product, and therefore receive this discount, within day.

National Grid's belief is that this would undermine the current within-day firm product, particularly due to the relatively low levels of scaleback seen historically of the off-peak / interruptible day ahead product. This would essentially mean that some User's would effectively be getting a pseudo firm product as a discounted price which would have an impact on wider Users charges. National Grid has considered options relating to reducing the quantity of capacity available for this product, however, no suitable solution has been found which wouldn't undermine the existing within-day firm product. Therefore, National Grid's attention will be on developing a shorter term flexible product as requested by industry.

This work stream will also develop options around a shorter-term flexible product to allow Users to respond swiftly to rapid changes within the electricity market. As illustrated on the timeline below, it is hoped that an option can be found to meet the requirements of Industry and National Grid by the end of the calendar year. NGN's and WWU's views were that this flexibility needs to be made available to DNs so they can provide the same flexibility to electricity generators connected on their networks.

Review of the Exit Regime

Throughout 0705R NTS Capacity Access Review discussions, NG have committed to reviewing the exit capacity regime in its entirety. This review will include a high-level consideration of more general, principles based questions around the Exit regime such as;

- What does the exit capacity regime need to deliver to which industry participants?
- What are the principles that need to underpin the exit regime? This is including, but not limited to understanding whether different rules or their interpretation is due given the needs of different market participants explored as part of the first question.
- How does the regime need to change to facilitate this?

This will combine with more specific consideration of particular elements of the regime. Work carried out to date under 0705R NTS Capacity Access Review, has begun this process. As outlined in the paragraphs above this has included;

- Consideration of the User Commitment requirements
- Substitution process and methodology
- PARCA arrangements
- Capacity product developments

Further development of these specific areas (along with consideration of the impacts of the Enhanced Obligation Framework, how the facilitation of information exchange is better facilitated and reviewing the flex and pressure processes currently available for DN's), combined with the resolution of the higher-level general principles questions, will enable National Grid and Industry to understand what further, possibly more fundamental, solutions may be required.

As shown in the timeline below, it is anticipated that changes can be identified by May 2021 with their implementation after that. Leading up to that will be developing an understanding of the needs of different exit industry participants by November 2020. The aim would then be to identify and agree the principles that should underpin a future regime by January 2021.

Long term regime

The Long-Term review is focusing on the development of the Capacity Access Regime out to 2030 and is being conducted as a joint project alongside the Gas Markets Action Plan (GMAP), Balancing Regime Review <https://futureofgas.uk/balancing/>. This collaboration seeks to establish economic and efficient market mechanisms to facilitate the transition to a low carbon energy system over the next 10 years. The four largest likely physical changes to the energy networks over this period have been outlined in order to assess the requirements of a new regime.

These are:

- increased reliance on renewable power generation
- large volumes of biogas entering both the GDNs and the NTS
- small volumes of hydrogen being blended into the NTS and regional difference in energy use beginning to emerge across the networks.

An external work group has been established to consult on the project and there will be extensive industry engagement conducted throughout. The project is expected to run for 6 months and will output initial recommendations and areas for further development.

Future work and timescales

As illustrated in the paragraphs above and the timeline below, some of the work streams in flight are expected to continue past October 2020. Furthermore, to date, the work considered under the Capacity Access Review has been more reactive to current problems with the existing capacity regime. Often these have required changes to be implemented in short timescales which has meant more immediate fixes to existing frameworks being considered. Over the next 12 months, however, a more principles-based approach will be taken alongside the work carried out on the detail of specific elements of the regime to develop more fundamental changes to the regime if required.

Additionally, it is expected that the work being carried out as part of the GMaP work will generate further work streams to be included as part of the Capacity Access Review as markets develop to meet decarbonization targets.

Part Two - Request Update May 2021

Request 0705R NTS Capacity Access Review was raised on 17 October 2019 and has been actively discussed at the Transmission Workgroup meetings. In addition, National Grid have conducted offline meetings with key stakeholders. The following section builds on the Workgroup report submitted to Panel in October 2020 where the Capacity Access Review was extended for a further 12 months. The purpose of this report is to provide an update as to developments since October 2020 and outlines future work. Each topic is discussed separately.

Overrun Charges

Following the implementation of UNC Modification 0716 “Revision of Overrun Charge Multiple” National Grid committed to further reviewing the Overrun regime once the new charging methodology had been in place for a year following the implementation of UNC Modification 0678A “Amendments to Gas Transmission Charging Regime” in October 2020. Since implementation of Modification 0678A National Grid has been monitoring and publishing the quantity of both Entry and Exit overruns on a monthly basis under the relevant Transmission Workgroup folder on the Joint Office website. This data will feed into the further review.

Workgroup Participants wished to note that the Overrun data presented at the Transmission Workgroup on 06 May 2021 showed a significant increase in the costs associated with overruns since the change in Charging Methodology from 01 October 2020:

Table 1: Summary of Entry overrun data (October 2020 - February 2021)

Entry	No of Overruns	Charge Quantity (mcm)	Charge Amount (£)	No of Users	No of ASEPs
Oct-20	319	10.84	270,470.21	31	9
Oct-19	129	3.40	34,373.94	21	8
Nov-20	369	15.83	442,615.19	25	8
Nov-19	98	3.77	10,749.94	17	9
Dec-20	403	7.63	180,741.39	26	10
Dec-19	123	5.41	35,823.08	18	7
Jan-21	379	8.73	203,889.59	23	8
Jan-20	200	6.64	69,319.21	25	10
Feb-21	410	8.31	196,899.49	24	8
Feb-20	117	2.93	30,807.88	15	8
Total to date 20/21	1880	51.34	1,294,615.87		
Total to date 19/20	667	22.16	181,074.05		

Table 2: Table 1: Summary of Exit overrun data (October 2020 - February 2021)

Exit	No of Overruns	Charge Quantity (mcm)	Charge Amount (£)	No of Users	No of Offtakes
Oct-20	141	14.52	182,525.67	17	30
Oct-19	1	0.21	2,874.67	1	1
Nov-20	173	15.24	189,860.56	20	31
Nov-19	0	-	0.00	0	0
Dec-20	185	15.36	185,170.44	22	33
Dec-19	0	-	0.00	0	0
Jan-21	142	10.25	131,626.60	17	31
Jan-20	2	0.02	1.32	1	2
Feb-21	167	9.57	105,589.58	16	30
Feb-20	8	1.24	8,746.03	4	4
Total to date 20/21	808	64.93	794,772.85		
Total to date 19/20	11	1.46	11,622.02		

Some Workgroup Participants requested consideration of a reduction to the overrun multiplier from 3, perhaps 1.5 could be considered?

National Grid confirmed that the data is under review and this can be brought forward from October 2021 if appropriate. Some Workgroup Participants wished for this to be considered in the short term rather than after October 2021 and asked for further analysis to be presented at the next Workgroup. National Grid suggested this might cover % overrun compared with capacity booked, with categorisation of User Types, similar to the data presented under Modification 0761.

A DN Workgroup Participants noted that a reduction in the multiplier may have the effect of reducing the deterrent effect. Other Workgroup Participants wished to consider the data more fully before conclusions are drawn.

Entry User Commitment

In the October 2020 Workgroup Report the proposed change to the Entry User Commitment rules was outlined. This change reduces the baseline capacity commitment required to trigger substitution and obligated funded incremental capacity from 16 quarters to 4 quarters in a 32-quarter period. This change is currently being progressed through the review to the capacity Methodology statements and is expected to be implemented in July of this year. This has not required a UNC Modification.

Exit User Commitment

Exit capacity booked through the Enduring Annual NTS Exit capacity product is subject to a period of 4 years of user commitment. The October 2020 0705R report (see page 8) outlines the issues experienced by Users due to the length of this commitment. Following discussions in Workgroups, National Grid agreed to reduce the User Commitment for capacity within baseline from 4 years to 2 years. This change is now being implemented into the Exit Capacity Release methodology statement through the review of those methodology statements and is expected to be in place in July 2021. This has not required a UNC Modification.

Substitution

This Workgroup had been looking at various options to improve the substitution process according to feedback received. Options considered were detailed in the October 2020 Workgroup report. Following these discussions National Grid is implementing a change to both the Entry and Exit Capacity Substitution methodology statements to prioritise capacity at disconnected sites in its substitution analysis. Again, this change is being progressed through the capacity methodology statement review. This does not require a UNC Modification.

Secondary Capacity Assignments

Following discussions, National Grid raised a pre-modification to introduce secondary capacity assignments for Entry and Exit. However, feedback was that the Entry capacity assignments modification was not suitable on the basis that it was proposed, therefore that modification was withdrawn. For Exit capacity assignments, UNC Modification 0755 “Enhancement of Exit Capacity Assignments” was raised which enables Users to transfer exit capacity and the associated liabilities in full or in part at an Exit point. Modification 0755 is currently progressing through Transmission Workgroup and is due to report to the Panel in June 2021. <https://www.gasgovernance.co.uk/0755>

Capacity Product Development

Since the Workgroup report in October 2020, National Grid has developed (through the 0705R Workgroups) and raised UNC Modification 0759S “Enhancements to NTS Within-Day Firm Entry and Exit Capacity Allocations”. This Modification seeks to provide Users with greater access and flexibility to purchase Entry and Exit capacity within the Gas day and is currently progressing through Transmission Workgroup. Modification 0759S is due to report to the Panel in June 2021. <https://www.gasgovernance.co.uk/0759>

Towards the end of 2020, the suitability of the currently available Entry products for LNG was discussed through 0705R Workgroup before UNC Modification 0752 “Introduction of Weekly Entry Capacity Auction” was raised by South Hook Gas. National Grid has since been facilitating that modification and it is currently in the final stages. The consultation is due to finish on 11 May 2021 with a Final Modification Report (at short notice) to the Panel in May 2021. <https://www.gasgovernance.co.uk/0752>

Relating to capacity product development, over the coming months National Grid plans to review with Workgroup 0705R the products currently available to ensure the products offered are relevant, provide Users with required access and explore any other potential opportunities that could be delivered through the capacity products offered.

Review of the Exit Regime

As part of RII02, a new Licence condition was introduced which required Gas Transporters to comply with the Exit Capacity Planning Guidance (ECPG). The ECPG provides a framework for processes

and activities to ensure efficient capacity bookings are made that benefits the total gas transportation network. Considering this, National Grid is looking at various aspects of the Exit capacity regime with Workgroup 0705R, including User Commitment, substitution (including the possibility to move capacity between Exit points within the same LDZ), the PARCA process and ensuring the total gas network can be accessed efficiently. This will be with the ambition of creating an exit regime that better meets the differing needs of all market participants.

Long-term Access Regime

This Workgroup is working closely with the Gas Markets Plan (GMAP²). Working with members of the GMAP Balancing and Capacity working group, a scenario which outlines the expected physical and commercial landscape in 2030 has been developed. This, along with the previously identified functions required of an access regime, will be used to assess a series of options. These options include:

- Implicit allocation
- Access with no upfront financial commitment (commitment around forecasting)
- Daily access as implicit allocation
- Flexibility as a product (purchase an “access pass”)
- Short-term access right booked only.

Next steps are to develop a series of triggers to monitor the materialization of the changes identified in the scenario to identify the directions and speed of travel. This will result in a report outlining findings and seeking industry views.

Future work and timescales

Over the coming months, it is proposed the focus of Workgroup 0705R will be the following;

- Review of the Exit Regime, including;
 - o further reduction of User Commitment for capacity within baseline and incremental capacity;
 - o moving capacity between exit points within the same LDZ;
 - o ensuring that all network Users can efficiently book required capacity.
- Entry and Exit capacity product development
- Overruns
- Development of options for a long-term access regime.

It is proposed that these areas are developed in conjunction with Industry through bilateral meetings and topic specific workshops, returning to Transmission Workgroup as and when required.

Some Workgroup Participants asked for inclusion of a review of constraint management tools in the above list. National Grid agreed to investigate options for inclusion of this area of work.

Part Three - Request Update Oct 2021

Request 0705R NTS Capacity Access Review was raised on 17 October 2019 and has been actively discussed at the Transmission Workgroup meetings. In addition, National Grid have conducted offline meetings with key stakeholders. The following section builds on the Workgroup report submitted to Panel in May 2021. The purpose of this report is to provide an update on discussions and developments since May and concludes with a request for a further extension of the timeframe for the workgroup.

Overrun Charges

The Workgroup has continued to review and debate the issues arising from analysis provided by National Grid. Comparison has been made between years to identify where changes have occurred. This has included looking at the number of users affected, the number of instances as well as the volume and value of the overruns.

Incremental capacity triggered through PARCA

National Grid has provided views to the October workgroup that there is a risk that reducing User Commitment could lead to an increased requirement for substitution analysis.

Historically substitution analysis has taken between 7-14 weeks to carry out. National Grid is funded through RIIO-2 to carry out a particular volume of substitution analysis based on passed requirements. A significant increase in this work may be unsupportable. An alternative option could be that the long-term auction is retained for baseline capacity bookings but that incremental bookings are made through the PARCA process. This may have an additional advantage of providing consistent levels of information.

National Grid will further develop this thinking.

Moving Capacity between offtake points

National Grid has developed criteria for acceptance/rejection of requests. Sample analysis has been provided to the Workgroup to illustrate how this might be operated. This work has included consideration of how multiple requests b(y different Users) might be handled.

Long-term Access Regime

The Long Term Access Review workstream is investigating whether the fundamentals of the Capacity Regime as we know it today are still appropriate and desired for a different energy landscape that we expect to see by 2030.

- A consultation last year helped to develop and agree the functions of the capacity regime.
- A second consultation document has now been published by National Grid outlining thinking and discussions so far. Stakeholders have been invited to feedback views on scenario and solution options by 30th November 2021.

Future work and timescales

The Workgroup requests further time to develop its conclusions. In particular in this context is the consultation exercise currently underway. The Workgroup is expecting to receive some concluding analysis from National Grid on overruns in November. The workgroup intends to develop this workgroup report further with a view to concluding in for December 2021.

Part Four - Request Update Dec 2021

Since the latest substantial Request update in May 2021, 0705R “NTS Capacity Access Review” has continued to focus on a number of areas with the aim of solving short-term issues, including overrun charges, exit user commitment, moving capacity between offtake points, secondary capacity assignments, capacity product development. Also provided is a brief overview of the long-term access review carried out through the Gas Markets Plan (GMAP). With this update National Grid proposes to close 0705R.

Overrun Charges

National Grid has continued to provide monthly reporting on Overrun volumes and charge quantities. As part of UNC 0716 “Revision of Overrun Charge Multiplier” National Grid suggested that a review of the Overrun multipliers could be carried out after the charging reforms introduced as per 0678A had been implemented for one year. Given ongoing developments of the charging arrangements National Grid does not believe this is an appropriate time to be amending the Overrun framework further.

Some workgroup participants had welcomed the proposed review in line with the Ofgem decision letter and hoped that such review by National Grid would still take place.

All Shipper workgroup participants observed that the level of aggregate overrun penalty in the current regime is large on relatively modest volumes of overrun and that a review in the short term would be appropriate.

All Shipper workgroup participant disagreed that the number of other changes currently underway in the regime would preclude a review of the overrun multiplier charges.

Some Workgroup participants requested that National Grid continue to provide analysis of overruns on a monthly basis and commit to a review of the data on a quarterly basis so that a coordinated approach might be adopted to resolve concerns.

Exit User Commitment

Previously, as part of 0705R, it was agreed to reduce user commitment applicable to baseline Enduring Annual Flat Exit Capacity (EAFLEC) from 4 years to 2 years. Over recent months we have been discussing reducing EAFLEC which triggers incremental capacity which is subsequently fulfilled by substitution from 4 years to 2 years. National Grid has agreed to this change and will progress the required amendment to the Exit Capacity Release methodology statement in due course.

Some DN Workgroup participants welcomed the changes being pursued by National Grid.

Moving Capacity between offtake points

National Grid has been exploring a proposal to enable previously booked capacity at an exit point, to be subsequently moved to another exit point. Through discussions it was identified that the most appropriate scenario for this proposal to be developed would be when the capacity booked is within baseline and would continue to be within baseline at the receiving point. It is envisaged that this proposal would most predominately be utilised by the Gas Distribution Networks to secure geographical accuracy of their NTS capacity bookings.

In May 2021 Ofgem issued a consultation titled, “Informal consultation on removing user commitment for Gas Distribution Networks (“GDNs”) booking exit capacity up to and including baseline”. Ofgem are yet to publish their conclusions following the close-out of this consultation. In the situation whereby it is decided to remove User Commitment for baseline exit capacity, a proposal to move capacity between exit points becomes obsolete. For this reason, National Grid will be halting work on this proposal until more clarity on future baseline User Commitment is achieved.

Some DN Workgroup participants agreed with the proposals being made by National Grid and asked for an indicative timeframe to be provided by Ofgem for the outcome of its consultation.

Secondary Capacity Assignments

Previously as part of 0705R, we proposed Modification 0755 to enhance the current exit capacity assignments. When proposing that Modification, we also proposed to introduce the concept of Entry capacity assignments. However, Industry participants at Transmission Workgroup, fed-back that our proposal was not useful and therefore we withdrew the proposed modification. Since then, and this Workgroup report update in May 2021 (Part two), Industry participants told us that Entry capacity assignments would be beneficial on the basis we originally proposed. Therefore, we have raised UNC Modification 0779 “Introduction of Entry Capacity Assignments” which has been joined by an alternative modification, 0779A raised by RWE.

Capacity Product Development

Following on from the previous work completed to develop the capacity products (introduction of Entry Weekly auctions and enhancements to the within day firm entry and exit allocations) National Grid looked at developing a medium-term (e.g. quarterly, monthly) exit product. However, after seeking views we did not receive any overwhelming support for this product from industry participants and therefore will not be developing any further.

The other product development that was considered as part of 0705R “NTS Capacity Access Review” was the removal, and replacement of the entry QSEC product due to its lack of utilisation. Industry fed-back that a long-term entry product may still be required in the future as markets develop towards achieving net zero ambitions, even if not utilised today. Therefore, National Grid does not believe the costs and benefits measure up for this review at this stage.

Long-term Access Regime

Development of the long-term access regime has continued as part of the Gas Markets Plan (GMAP) where more whole-scale, transformational is being considered. We have developed a 2030 scenario of the physical and behavioural changes anticipated and developed a series of options which vary in their level of transformation. We are testing this with Industry participants, along with seeking views on preferable options. This will enable us to develop a pathway towards a future access regime guided by early indicators which will inform development of a change roadmap.

Conclusion

Initially 0705R “NTS Capacity Access Review” started with the ambition to review the foundations and principles of the Capacity Access Regime. However, it quickly became evident that it would be more appropriate to keep the scope of this Request to working to solve immediate problems in the shorter-term and the longer-term more transformational change being progressed through the Gas Markets Plan (GMAP).

In this section we have outlined the work we have done, how this has progressed as well as anything we looked at which didn’t come to fruition. In summary the following UNC Modifications have dropped out of discussions through 0705R “NTS Capacity Access Review”;

- Modification 0716 “Revision of Overrun Charge Multiplier”
- Modification 0755 “Enhancement of the Exit Capacity Assignments”
- Modification 0759S “Enhancements to NTS Within-Day Firm Entry and Exit Capacity Allocations”
- Modification 0752 “Introduction of Weekly Entry Capacity Auction”

- Modification 0779 “Introduction of Entry Capacity Assignments”

The following changes to the methodology statements have resulted from 0705R “NTS Capacity Access Review”;

- Reduction of Entry User Commitment - Entry Capacity Release Methodology Statement (July 2021 update)
- Reduction of baseline Exit User Commitment from 4 years to 2 years – Exit Capacity Release Methodology Statement (July 2021 update)
- Prioritisation of disconnected sites as donor sites in substitution analysis – Entry Capacity Substitution Methodology & Exit Capacity Substitution Methodology (July 2021 update)
- Additional rule to ensure capacity indicated as required through the demand forecasts provided via Exit Capacity Planning processes is not substitutable capacity – Exit Capacity Substitution Methodology (July 2021 update)
- Reduction of incremental (fulfilled by substitution) Exit User Commitment – Exit Capacity Release Methodology Statement (tbc update)

5 Recommendations

Workgroup’s Recommendation to Panel

The Workgroup recommends that the Panel now consider this report and consider whether the Request should be closed.
