# NDM Sample Update

## Points to Note since last DESC

---

- Overall deficit remains in Datalogger population, however.....
- Analysis required for Autumn algorithm performance (NDM sample analysis) provides a useful 'half way health check' of sample numbers
- Validated numbers for Large NDM supply points were in line with Spring 2008 numbers
  - Bands 05, 06 and 07 slightly better
  - Band 08 slightly worse
- Should validated numbers in Spring '09 decline at higher bands then Spring Approach methodology will address this
- xoserve continue to work with Transporters to assist in achieving targets
  - National Grid confirmed approval has been gained to install significant numbers of devices to address target deficits
  - Remaining Networks also actively addressing their NDM sample targets
- Datarecorder numbers very healthy (above target) – no concerns for Spring analysis
