

Distribution Workgroup Issue – Linked Capacity

John Baldwin comments

I saw it much simpler . Firm exit capacity would be available ONLY if a named local biomethane site was injecting into that grid. If the biomethane site is not injecting (or reduced) then the GDN may not be able to supply the exit and there would be no penalties if the load had to be interrupted

This is the scenario we have on a number of projects (Cadent and SGN). We are not seeing this as helping to inject more biomethane, the Reverse Compression option sorts that.
