1 Request

This Request is being proposed to investigate how the industry (via Demand Estimation Sub Committee - DESC) could improve the accuracy of the NDM demand modelling process further by utilising more advanced analytical approaches e.g. Machine Learning.

This follows on from findings presented by the Unidentified Gas (UIG) Task Force which identified that the NDM Modelling error, which is a significant contributor to the both the levels and volatility of Unidentified Gas, could be materially reduced further using such techniques.

Demand Estimation Sub Committee (DESC)

Each year DESC are responsible for confirming the End User Category (EUCs) Definitions, Gas Demand Profiles - Annual Load Profiles (ALPs), Daily Adjustment Factors (DAFs) and Peak Load Factors (PLFs). DESC also have the responsibility for reviewing the effectiveness of the NDM Algorithm every 3 years, which is now due. The timetable that DESC follows for its annual 'Business as Usual (BAU) activities', particularly from March to August, does not contain a significant amount of available time for exploring alternative demand modelling options. The review of the performance of EUC demand models and any ad-hoc analysis is usually performed each Autumn/Winter period. In recent years this has included changing the EUC definitions within Bands 1 and 2 (Annual Quantity (AQ) range 0-293MWh pa) and the formula for deriving the Composite Weather Variable (CWV) (now includes a Solar Radiation term), both of which have contributed to improved EUC demand models and subsequently lower UIG.

Unidentified Gas (UIG) Task Force

The UIG Task Force was established to investigate all the possible causes of UIG and provide recommendations for resolving them. The daily estimate of NDM demand inevitably contains error, however the Task Force recommendation suggested the current approach to demand modelling could be improved with the use of Machine Learning* techniques.

*This is explained further within the "Machine Learning Options Paper" link provided in the "Additional Information" section below.

NDM Algorithm Consultation

In Q4 of 2020, an industry consultation was carried out to explore just how much change in the NDM Algorithm it was prepared to accept ahead of performing any investigative analysis. The results provided clear 'red-lines' in terms of the ALPs and DAFs. These parameters are used extensively across the industry and in many other processes and so any demand modelling approach changes should ensure these parameters are retained and therefore limit any updates to systems for most industry participants.

The establishment of a UNC Workgroup will allow any investigative work to proceed at a reasonable pace, given the already busy DESC schedule, and increase visibility of progress across the industry.

The ultimate impact of changes brought about by this Workgroup should be a better alignment of energy first time around between NDM Allocation and UIG i.e. less modelling error. This would also subsequently result in lower reconciliation/UIG volumes.

Scope

The proposed scope of this review is to consider different options of advanced analytic techniques to produce the underlying EUC Demand Models that are required to create the key parameters of ALP, DAF and PLF. The Workgroup may investigate and recommend changes to the components and calculation of parameters associated to the CWV. Currently out of scope are any options which remove the following parameters: ALP, DAF, PLF, CWV and Seasonal Normal CWV (SNCWV).

The Workgroup could refer to the work done by the UIG Task Force as a starting point and/or consider any alternatives from interested industry participants.

For the Workgroup to maintain good progress and meet its timescales it will be necessary for industry participants to participate in the review and where relevant provide options and resource as it may not be possible for the CDSP to:

- a) perform all the analysis of various options (given its commitments to DESC); and
- b) have the necessary knowledge/experience in advanced analytic techniques such as Machine Learning.

On this basis it may require specialist advice which may not be available within the Workgroup. Should this be the case any third-party support requirements would need to be approved accordingly via DSC processes.

Impacts & Costs

The CDSP is most likely to be impacted, if any recommendations contained within the Workgroup Report are then taken forward, via Modifications etc., and ultimately implemented, given it is currently responsible for the production of the annual Gas Demand Profiles.

Any diversion from the current modelling approach will need to be reflected in updates to both its own and Shippers Demand Estimation modelling systems, policies and procedures.

In addition to publishing the headline parameters of ALPs, DAFs and PLFs, a number of supporting files are produced for the industry which include the underlying demand model calculations, the format of these are likely to change in the event the process/approach to producing the demand models is significantly different.

The values of the ALPs, DAFs and PLFs themselves could be markedly different to the current view, this may lead to a 'step change' in some of the downstream calculations such as NDM AQs and System Offtake Quantities (SOQs), however any change in the approach to the demand modelling should have proved itself to be a 'better' answer than the current calculation and so any movement in these values should be welcomed but also trailed well in advance of being used.

Recommendations

It is recommended that this topic is referred to a separate UNC Workgroup, to allow proper discussion of the topic and development of options.

3 Terms of Reference

Background

The Xoserve UIG Task Force reported that NDM modelling error is a significant factor in UIG volatility and that the use of advanced analytics such as Machine Learning, can contribute to reducing this error. The results of the Xoserve led industry consultation on the future of the NDM Algorithm concluded there was strong support for investigating advanced analytic options within certain boundaries (e.g. retain ALPs and DAFs). Improved NDM Allocation will result in a reduction in UIG volatility and subsequent Meter Point reconciliation/UIG volumes.

Topics for Discussion

- Understanding the objective
- Review UIG TF outcomes/analysis
- Confirm scope (consultation conclusions)

- Identify resources / expertise needed
- Agree Timescales
- Determine Data Requirements, Measures and Success Criteria
- Determine options for analysis
- Impact Assess the options
- Shortlist options before analysis
- Perform analysis
- Asses results against Success Criteria
- Development of Solution (including business rules if appropriate)
- Assessment of potential impacts of the Request
 - include any potential Cross Code impacts
 - Consider any potential impacts of the Significant Code Review and associated Code Freeze window
- Assessment of implementation costs of any solution identified during the Request
- Assessment of changes to UNC Related Documents and any legal text.

Outputs

Produce a Workgroup Report for submission to the Modification Panel, containing the assessment and recommendations of the Workgroup including a draft Modification where appropriate.

Composition of Workgroup

The Workgroup is open to any party that wishes to attend or participate.

A Workgroup meeting will be quorate provided at least two Transporter and two User representatives are present.

Meeting Arrangements

Meetings will be administered by the Joint Office and conducted in accordance with the Code Administration Code of Practice.
