# Calculation of Mismeasurement due to incorrect installation of orifice plate using CFD

ITE 1 – TÜV SÜD National Engineering Laboratory

Presented by Craig Marshall  
27/07/22

# Summary of ITE 1 Results

- During the mis-measurement period the total measured flowrate was 14,426 GWh and 1,324.1 million Sm<sup>3</sup>
- There was an undermeasurement of 867.09 GWh and 79.441 million Sm<sup>3</sup>
- This mis measurement was calculated based on a change in discharge coefficient predicted through CFD.
- The CFD was validated using previous published data for similar orifice plates with good agreement

| Case (Reynolds number)       | Discharge Coefficient - CFD Ideal | Discharge Coefficient - CFD Reversed | Shift In Discharge Coefficient (%) |
|------------------------------|-----------------------------------|--------------------------------------|------------------------------------|
| Low Flow (Re 7,095,465)      | 0.59706                           | 0.63556                              | 6.45                               |
| Medium Flow (Re 14,190,929)  | 0.59377                           | 0.63465                              | 6.88                               |
| Maximum Flow (Re 26,607,993) | 0.59119                           | 0.63475                              | 7.37                               |

# Description of CFD

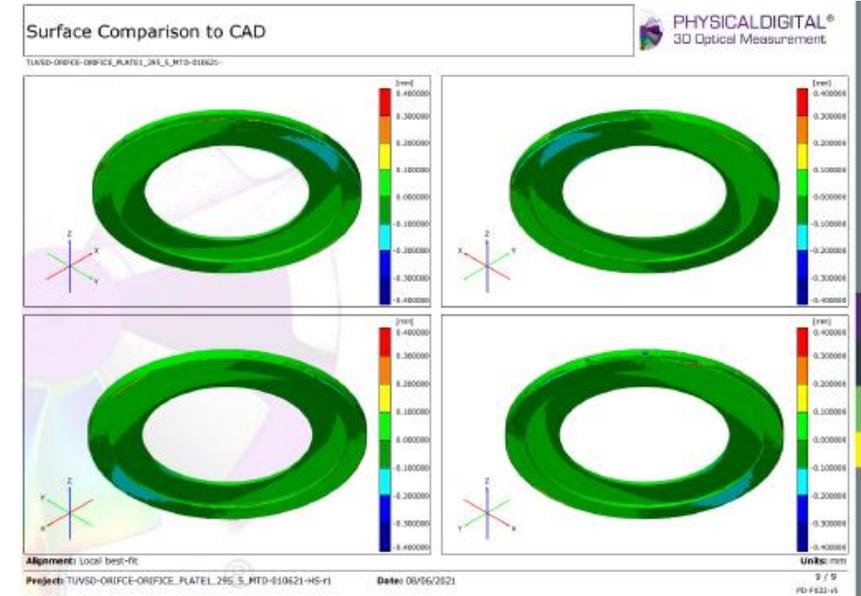

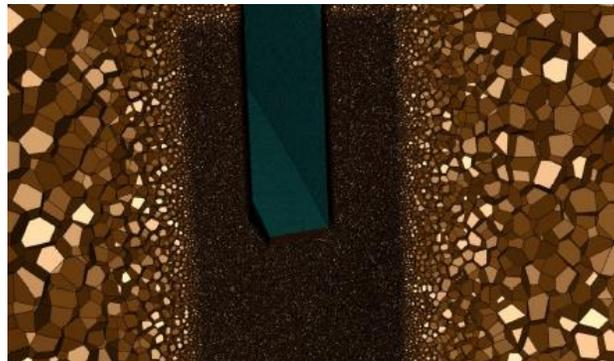

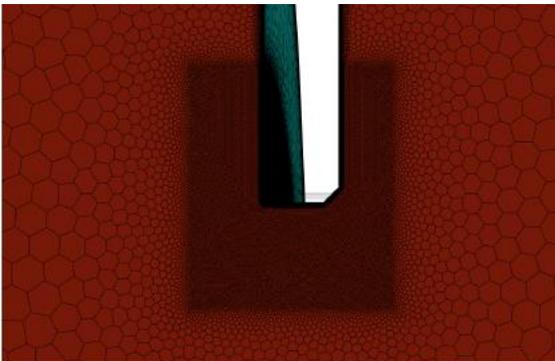

- ANSYS FLUENT 2021 R1 used for all simulations
- The simulations were run under ideal conditions, to confirm modelling accuracy, and then with plates installed backwards

TABLE 1: SIMULATED CASES

| Case   | Inlet Velocity (ms <sup>-1</sup> ) | Density (kgm <sup>-3</sup> ) | Viscosity (kgm <sup>-1</sup> s <sup>-1</sup> ) | Reynolds Number | Mass Flowrate (kgs <sup>-1</sup> ) |
|--------|------------------------------------|------------------------------|--|-----------------|------------------------------------|
| Low    | 4                                  | 49.38                        | 1.20 x 10 <sup>-5</sup>                        | 7,095,190       | 28.98                              |
| Medium | 8                                  | 49.38                        | 1.20 x 10 <sup>-5</sup>                        | 14,190,381      | 57.96                              |
| High   | 15                                 | 49.38                        | 1.20 x 10 <sup>-5</sup>                        | 26,606,964      | 108.67                             |

# Description of CFD

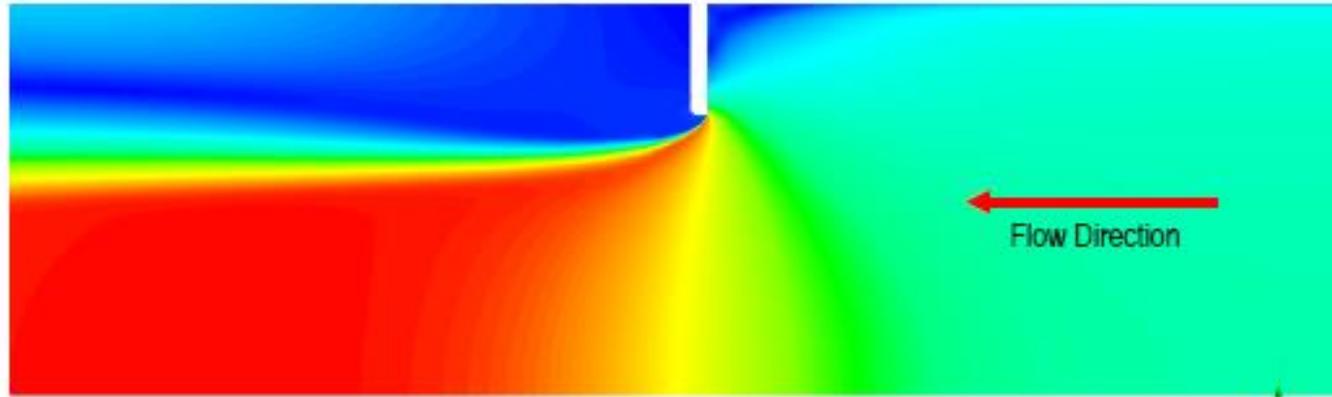

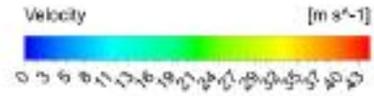

- Plates were laser scanned for dimensions
- Models of scans were created and used for simulations
- Simulation were ran as quarter symmetry models to reduce computation time
- Pressure tapping dimensions were not available at time of modelling
- Very high quality unstructured polyhedral mesh used with refinement at plate

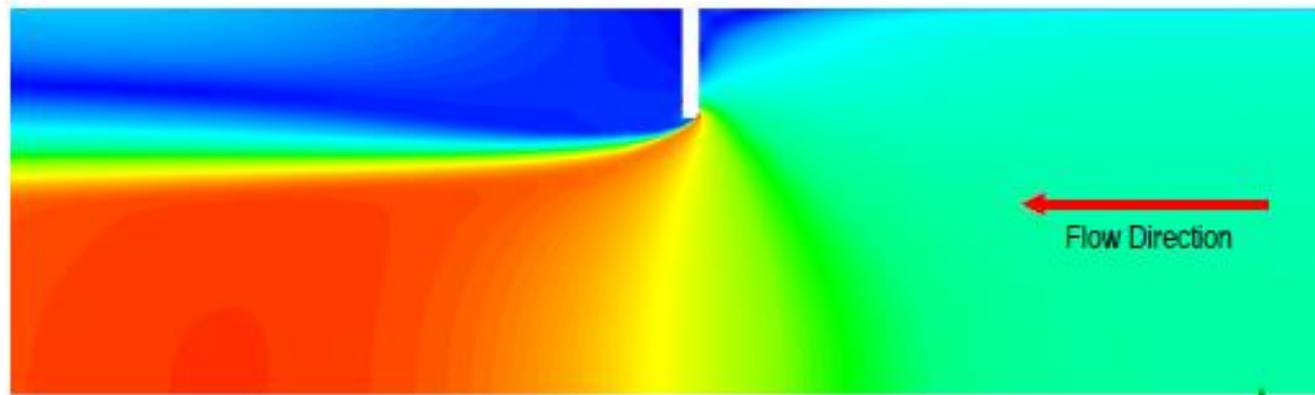

# Mesh Independence

| Case                      | BOI 1 Cell Size (mm) | BOI 2 Cell Size (mm) | Max Mesh Size (mm) | Discharge Coefficient (Ideal) | Difference (%) |
|---------------------------|----------------------|----------------------|--------------------|-------------------------------|----------------|
| Low Flow (Plate 5036)     | 0.2                  | 4                    | 12                 | 0.59496                       | 0.10           |

Comparison of Errors in Discharge Coefficient from CFD, Correlation

# Summary of ITE 1 Results

- During the mis-measurement period the total measured flowrate was 14,426 GWh and 1,324.1 million Sm<sup>3</sup>
- There was an undermeasurement of 867.09 GWh and 79.441 million Sm<sup>3</sup>
- This mis measurement was calculated based on a change in discharge coefficient predicted through CFD.
- The CFD was validated using previous published data for similar orifice plates with good agreement
